

Druid Hills Eyecare, Inc.

We are proud to introduce new and highly sophisticated diagnostic instruments in our office. This state-of-the-art computerized equipment enables us to provide a more thorough visual field and digital retinal photography analysis.

Digital retinal screening is a new technology in which we can take digital color photographs of the retina. The detailed images of the optic nerve, blood vessels, nerve fiber layer, and the macula can show abnormalities that may threaten normal vision.

Visual field testing gives the doctor essential information about major blindness-causing diseases. This testing allows early detection and close monitoring of the progress of glaucoma, retinitis, age-related macular degeneration, and other ocular diseases, significantly enhancing the chances for successful treatment.

We highly recommend both tests as part of your comprehensive visual analysis. These tests are not covered by your insurance, so it will be an additional \$25 fee.

We will not have to dilate your eyes if you choose this testing, unless the doctor finds it medically necessary.

Would you like to have these tests done?

YES
